Detailed specifications

All the assessments listed here employ S&P Global Energy, Platts Assessments Methodology, as published at https://www.spglobal.com/content/dam/spglobal/ci/en/documents/platts/en/our-methodology/methodology-specifications/platts-assessments-methodology-guide.pdf

These guides are designed to give Platts subscribers as much information as possible about a wide range of methodology and specification questions.

This guide is current at the time of publication. Platts may issue further updates and enhancements to this guide and will announce these to subscribers through its usual publications of record. Such updates will be included in the next version of this guide. Platts editorial staff and managers are available to provide guidance when assessment issues require clarification.

All price assessments are published according to the publication schedule which can be found here https://www.spglobal.com/platts/en/our-methodology/holiday.

Electricity price assessments

In Europe Platts publishes electricity assessments for the UK and the Netherlands markets. Platts assessments are based on standard contract definitions and volumes.

In addition to its own assessments, Platts also publishes settlement values, based on the data from relevant exchanges which includes France, Germany, Spain and Italy.

UK

Assessments: Platts assesses over-the-counter (OTC) trade under the Grid Trade Master Agreement contract for the day-ahead (DA), weekend, next three months, next two quarters, next five seasons and the year ahead. During holiday periods Platts may assess prices for DA+1, DA+2, DA+3 and DA+4. Platts also assesses day-ahead, peakload, baseload, and prices for Block 5 and Block 1+2.

Platts DA assessments are databased both by trade date and by flow date.

Platts publishes DA power market assessments for Monday to Friday and a single weekend assessment for Saturday and Sunday. On Fridays, the day-ahead price reflects following Monday's delivery date.

Seasons are defined as follows: Winter = October-March; Summer = April-September.

Contract definitions: Baseload = 23:00-23:00, Peakload = 07:00-19:00 (London time). Platts does not assess the UK off-peak contracts (19:00-07:00 London time).

Day-ahead baseload delivery is from 23:00 the day of trade until 23:00 the day after; peakload delivery is 07:00-19:00 the day following trade.

Weekend baseload delivery is from 23:00 Friday until 23:00 on Sunday.

In the event of no confirmed peakload UK day-ahead trades before the market close, Platts assesses the implied value of the day-ahead peakload contract using OTC prices for individual intra-day Blocks. Electricity Forward Agreements (EFA) Block definitions (London time):

Block 1 = 23:00-03:00

Block 2 = 03:00-07:00

Block 3 = 07:00-11:00

Block 4 = 11:00-15:00

Block 5 – 15:00-19:00

Block 6 – 19:00-23:00.

All forward months, quarters and years are calendar months, quarters and years.

Delivery: Prices are for firm delivery on the high-voltage grid network of England, Wales and/or Scotland. This includes the Scotland-Northern Ireland interconnector but not Northern Ireland itself. Distribution network costs are not included. All prices are for physically delivered trades.

© 2025 by S&P Global Inc. All rights reserved.

Assessment range: Platts publishes a single value for its UK electricity assessments in European Power Daily and on European Power Alert.

Platts also publishes a low-high range around its assessments for UK electricity symbols in Market Data categories EE and PE, unless otherwise stated. The low and high reflect a fixed value on either side of the assessment. Low-high ranges for primary assessments in GBP/MWh are standardized to +/-15 pence.

Publication schedule: Platts publishes forward power assessments for the UK on all UK working days. Assessments for UK public holidays and the first working day following a UK public holiday weekend are published on the last working day before the public holiday. Ahead of public holidays, Block 5 assessments reflect the value of the Block 5 contract for the next working day. Eg. On Friday, ahead of a bank holiday Monday, the Block 5 assessments refer to Tuesday's Block 5 contract.

Timestamp:

Day-ahead contracts, including Block 5, and Block 1+2 – 9:20 am London time.

Weekend and forward contracts – 16:30 London time.

On certain days ahead of some UK Public Holidays, such as Christmas Eve and New Year's Eve, Platts publishes prompt and forward assessments at 12:30 pm London time. This is to take account of typically much lower liquidity and the earlier end of trade.

Monthly averages: Platts publishes monthly averages for day-ahead and month-ahead. For day-ahead, monthly averages are calculated on a flow-date and trade-date basis.

For flow date: monthly averages include all assessments reflecting delivery within a given month. For example, an August 1 day-ahead assessment would be included in the August average, although the contract traded on July 31. UK flow-date averages calculate Saturday and Sunday values based on Friday assessments of weekend delivery.

For trade date: monthly averages include Friday assessments of Monday delivery, but do not include weekends. The trade-date calculations do not include DA+1, DA+2, DA+3, orDA+4 prices assessed ahead of UK public holidays.

Rolling logic: All monthly, quarterly, seasonal and annual power contracts roll on the first working day of each new calendar period.

Platts Dutch Assessments

Assessment	Contract	Code	Date	Min Volume	Max Volume	Currency	UOM	Frequency	Timestamp
Month ahead	Baseload	AADMN00	Trade date	5 MW	20 MW	Eur	MWh	Daily	16:30 London time
Month ahead	Peakload	AADMP00	Trade date	5 MW	20 MW	Eur	MWh	Daily	16:30 London time

Germany Baseload Unit Conversions

	p/th	Eur/GJ	$/MMBtu
Germany Baseload Month Ahead	AANFA00	AANFB00	AANFC00
Germany Baseload Month Ahead +1	AANFD00	AANFE00	AANFF00
Germany Baseload Quarter Ahead	AANFG00	AANFH00	AANFI00

Netherlands

Assessments: Platts assesses over-the-counter trade for the Netherlands power grid for only month-ahead baseload and peak prices.

Contract definitions: Baseload = 24:00-24:00, Peak = 08:00-20:00 (Central European time).

Delivery: Prices are for firm delivery on the high-voltage grid network of the Netherlands. Distribution network costs are not included. All prices are for physically delivered trades.

Assessment range: +/- 5 euro cents for primary assessments in Eur/MWh.

Publication schedule: Platts publishes forward power assessments for the Netherlands on all UK working days.

Timestamp: 16:30 London time. On certain days ahead of some UK Public Holidays, such as Christmas Eve and New Year's Eve, Platts publishes assessments at 12:30 pm London time. This is to take account of typically much lower liquidity and the earlier end of trade.

Other European countries

Assessments: Platts publishes power settlement prices from the European Energy Exchange (EEX) for Germany, France, Italy and Hungary from OMIP for Spain. Energy Exchange Austria (EXAA), European Power Exchange (EPEX) for Germany, France, Switzerland, Belgium, the Netherlands. NordPool, N2EX, ENDEX, TGE.

Rolling logic: Platts rolls power contracts on the first day of each new calendar period. Platts rolling schedule differs from EEX's rolling schedule. Platts assesses quarterly and annual power contracts when it observes a mismatch between Platts and EEX power contracts' rolling dates. Roll dates for Spanish contracts correspond to those listed on OMIP.

Platts fuel spread calculations incorporate these power settlement prices.

Codes for these third-party data are not included in this guide and can be found in the Symbols Directory https://www.spglobal.com/platts/en/our-methodology/symbol-page-directories.

Renewable Capture price indices

Platts Renewable Capture Price Indices track weighted average prices that renewable energy generators receive for the electricity they produce across a daily period, based on hourly generation and pricing data.

Formula:

Sum of actual hourly generation * previous day's day-ahead hourly prices, divided by total generation across the day.

Inputs:

Belgium: Third-party EPEX spot day-ahead hourly price, third-party Entso-E data

Denmark, DK1, DK2: Third-party NordPool spot day-ahead hourly price, third-party Entso-E data

Finland: Third-party NordPool spot day-ahead hourly price, third-party Entso-E data

France: Third-party EPEX spot day-ahead hourly price, third-party Entso-E data

Germany: Third-party EPEX spot day-ahead hourly price, third-party Entso-E data

Italy: Third-party GME PUN spot day-ahead hourly price, third-party Entso-E data

Netherlands: Third-party EPEX spot day-ahead hourly price, third-party Entso-E data

Norway – NO1, NO2, NO3, NO4: Third-party NordPool spot day-ahead hourly price, third-party Entso-E data

Spain: Third-party OMIE spot day-ahead hourly price, third-party Entso-E data

Sweden – SE1, SE2, SE3, SE4: Third-party NordPool spot day-ahead hourly price, third-party Entso-E data

UK: Third-party N2EX spot day-ahead hourly price, third-party ELEXON data

Locations and Technologies:

Onshore, off-shore wind and solar: Belgium, Denmark - DK1, DK2, France, Germany, the Netherlands, UK.

Onshore wind and solar: Italy and Spain

Onshore wind: Finland, Norway - NO1, NO2, NO3, NO4, Sweden - SE1, SE2, SE3, SE4.

Units: Eur/MWh for Belgium, Denmark, Finland, France, Germany, Italy, Norway, the Netherlands, Spain, Sweden. GBP/MWh for the UK.

Publication schedule: Platts publishes Renewable Capture Price Indices on all UK working days.

Timestamp: The indices have a 1-working-day lag to account for operational generation data, and are published on the next working day. Data for Fridays and the weekend are published the next working-day.

In addition to the daily capture prices, Platts also publishes the monthly and quarterly volume-weighted capture prices and capture rates for the respective markets and technologies.

Platts battery spreads and duration ratios

Platts Battery Spreads represent the arbitrage opportunity in the wholesale electricity market between the charge of the Battery Energy Storage Systems (BESS) when the hourly electricity prices are lowest and the discharge when the electricity prices are highest for Germany, Spain and the UK. The index charge and discharge basis are one cycle a day, over one hour, two hours, and four hours. The duration ratios compare the one-hour cycle with two hours and four hours, and two hours versus four hours, which represents the duration ratio arbitrage. The data used from Nordpool, EPEX and OMIE is the delivered data prices for the day-ahead settled electricity contracts.

The index is based on the German, Spanish and UK wholesale hourly electricity prices for the day of delivery. The data is published daily from Monday to Sunday, and the conversions to EUR and USD for the weekend include the foreign exchange conversion assessed by Platts at 4.30 pm London time on a Friday or the last working day before a weekend.

Spark and dark spreads

In addition to spark and dark spreads, Platts publishes their clean equivalents, which factor in relevant emissions costs: Platts EU emissions Allowance (EUA) assessments for continental European countries and Platts UK Allowance (UKA) assessments for the UK. EUA and UKA prices reflect the nearest December annual expiry date. The calculation typically references the emissions contract most relevant to the delivery period for the fuel legs of the spread. In the UK, seasonal clean fuel spreads that include delivery during winter periods which touch on two calendar years use an average of two emissions contracts for the 'clean' component of the spread.

Platts clean fuel spread calculations incorporate three emissions contracts ahead with specifications and roll dates as listed on Platts Carbon methodology for both EUAs and UKAs https://www.spglobal.com/content/dam/spglobal/ci/en/documents/platts/en/our-methodology/methodology-specifications/energy-transition/carbon-markets-specifications.pdf.

For UK only Platts also publishes UK CPS clean spreads that incorporate the cost of the UK government's Carbon Price Support (CPS) levy at the confirmed rates for April 1, 2024 - March 31, 2025, and will remain until 2027, at GBP18/MWh.

Spark spreads

Platts spark spreads measure the difference between the cost of feedstock gas and the equivalent price of electricity on a High Heating Value (HHV) basis.

Locations: Platts publishes all simple spark spreads and clean spark spreads in the UK, Germany, Italy and Spain and CPS clean spark spreads in the UK only.

Assumptions: Gas-to-power energy conversion factor is as per the conversion factor methodology link spglobal.com/commodityinsights/PlattsContent/_assets/_files/en/conversiontables/conversion_factors.pdf

All spark spreads are published for gas-fired plants with efficiencies of 45% and 50% for all locations, and 60% for UK, Germany, and Italy.

Clean spark spreads are based on emissions intensity of 0.053942 tCO2e/MMBtu HHV (thermal basis, before combustion).

Formulas:

Baseload spark spread: Baseload power price – Gas price ÷ fuel efficiency.

Baseload clean spark spread: Platts spark spread – Relevant emissions price * emissions intensity factor ÷ fuel efficiency.

Baseload CPS clean spark spread (UK only): Platts baseload spark spread - (UKA emissions price + CPS levy) * emissions intensity factor ÷ fuel efficiency

Peakload spark spread: Peakload power price – Gas price ÷ fuel efficiency.

Peakload clean spark spread: Platts peakload spark spread – Relevant emissions price * emissions intensity factor ÷ fuel efficiency.

Peakload CPS clean spark spread (UK only): Platts peakload spark spread - (UKA emissions price + CPS levy) * emissions intensity factor ÷ fuel efficiency.

Inputs:

Germany: Platts TTF gas assessments and third-party power price settlements, Platts EUA assessments;

Italy and Spain: Platts assessments of relevant national gas contracts and third-party power price settlements, Platts EUA assessments;

UK: Platts assessments of power and gas contracts, Platts UKA assessments, relevant CPS levy as mentioned above;

Netherlands: Platts TTF gas assessments and Platts power price assessments, Platts EUA assessments;

France: Platts PEG gas assessments and third-party power price settlements, Platts EUA assessments;

The day-ahead gas assessments reflect the next UK working day.

Dark spreads

Platts dark spreads measure the difference between the cost of feedstock coal and the equivalent price of electricity.

Locations: Platts publishes dark and clean dark spreads in Germany.

Assumptions: Coal-to-power energy conversion is 6.978 (converting 1 metric ton of coal into MWh).

Dark spreads are published for coal-fired plants with efficiencies of 45% for Germany.

Clean dark spreads are based on emissions intensity of 0.757 mtCO2/MWh for 45% efficiency.

Formulas:

Dark spread: Baseload power price – Coal price ÷ energy conversion factor ÷ fuel efficiency.

Clean dark spread: Platts dark spread – Relevant emissions price * emissions intensity factor ÷ fuel efficiency.

Inputs:

Germany: Platts CIF ARA coal assessments, third-party EEX German electricity settlement prices, Platts EUA assessments.

Electricity generation economics

Platts publishes coal switching indicators and cross-fuel comparisons which aim at providing transparency into the electricity generation economics.

Coal switching price indicator (CSPI)

Platts CSPIs calculate the threshold at which gas is more competitive than coal as input fuel in power generation. When the gas price is higher than the CSPI, CCGT generation is more expensive than coal-fired generation and vice versa. The indicators are published for month-ahead, quarter-ahead and year-ahead.

Locations: the Netherlands.

Units: Eur/MWh.

Assumptions:

	Carbon emissions factor	Dutch plant efficiency
Gas	0.18404 mtCO2/MWh	45% and 50% HHV
Coal	0.34056 mtCO2/MWh (thermal basis, before combustion)	40% LHV

Formulas:

Netherlands: Gas efficiency * (coal price ÷ coal efficiency + (emissions factor for coal ÷ coal efficiency - emissions factor for CCGT ÷ gas efficiency) * (EUA emissions price + coal tax ÷ coal efficiency))

Inputs: Coal price = Platts CIF ARA coal price assessment as quoted in USD/mt and converted into Eur/MWh;

Netherlands: Power generators are currently exempt from coal tax. Previous Dutch coal tax rates were Eur14.40/mt for calendar year 2015 and Eur14.27/mt for calendar year 2014. From 2016 all coal plants with an efficiency of 40% or higher are exempt from the coal tax.

Cross-fuel comparisons

Platts cross-fuel comparisons represent indicative costs of burning gas and coal in power stations. In each case, the price of the fuel is converted into an equivalent electricity price.

Platts also publishes costs of offsetting equivalent CO2 emissions and total costs, which aggregate these two elements (CO2 emissions costs and generating costs).

Indicative natural gas and coal costs are compared with baseload power prices.

Assumptions:

	Plant efficiency, %	Emissions intensity, kg CO2/MMBtu
Natural Gas	50	53.937
Coal	35	99.64

	Plant efficiency, %	Emissions intensity, kg CO2/MMBtu
UK+CPS Natural Gas	50	6.62544
Coal	35	17.514

Inputs: Coal is priced at ARA. The standard specifications and sources of each fuel type can be found in the following documents published on https://www.spglobal.com/platts/en/our-methodology/methodology-specifications:

Natural gas - Platts European Natural Gas Specifications

Coal - Platts Coal Specifications

Bitcoin Quarq spreads

Platts Bitcoin Quarq spreads are daily values calculated for 43 locations using the local day-ahead electricity cost and Bitcoin price for the same day. The daily Bitcoin price is the simple average of Bitcoin prices from the day of power delivery. The electricity consumed to mine one Bitcoin is calculated using the hashrate required on the day as well as the average electricity usage of a standard graphic card Antminer S19 Pro, which has an average 110 TeraHashes per second (TH/s) using 3.25 Kilowatts. The corresponding day-ahead power price of each location is then used to calculate the cost of power to mine Bitcoin. Platts power price assessments are used for Into TVA (Tennessee Valley Authority), Into GTC (Georgia Transmission Corporation) and Mid-Columbia (Mid-C) and the UK, while, third party data is used in France and Spain, New York, California, Indiana Hub and Texas. The Platts Bitcoin Quarq Spreads are derived from the difference between the Bitcoin price and the electricity cost.

In addition to the Bitcoin Quarq spreads, Platts publishes Renewable Quarq spreads that use renewable sourced market-based attribute equivalents. The cost of relevant Renewable Energy Certificates (RECs) or Guarantee of Origin Certificates (GOs) are subtracted from the spread to calculate the mining profitability using renewable electricity. The references to the Platts assessed Renewable Energy Certificates (RECs) or Guarantee of Origin Certificates (GOs) can be found in the Global Renewables Certificates Guide: https://www.spglobal.com/commodity-insights/en/pricing-benchmarks/our-methodology/methodology-specifications/energy-transition

The calculation typically references the REC or GO contract most relevant to the production period for the spread. In the UK, the production period takes into account REGOs produced from April 1 of the current year to March 31 of the following year, but the compliance period goes from July 2 of the current year to July 1 of the following year. In all the US states for solar generation the production period is matched by rolling with the compliance period (April of year 1 to March of year 2), to match the rest of the certificates that run on a 12-month rolling calendar basis.

All calculations are converted to USD per MWh to have a like for like comparison across the world.

Bitcoin Energy Consumption Index

The Daily Bitcoin Energy Consumption Index represents the energy intensity to mine one Bitcoin in MWh per day, bringing transparency to the global bitcoin network energy consumption. The index accounts for the global bitcoin network hashrate in TeraHash per second, divided by the total amount of bitcoin mined per day to find the TeraHash per second for one bitcoin. Antiminer S19Pro graphic card is considered as a standard assumption, with 110 TH/s, and 3.25 Kilowatts used, to find the number of graphic cards needed to mine one bitcoin. The energy consumed by the total amount of graphic cards to mine one bitcoin, and constitutes the energy consumption in MWh the Bitcoin Energy Consumption Index represents.

S&P Platts Power Purchase Agreement Indices

Platts Energybegan publishing daily Power Purchase Agreements (PPA) indices on June 2, 2025.

Platts PPA indices reflect pay-as-produced PPA contracts for a duration of 10 years, with guarantees of origin (GOs) included. Such indices cover solar and onshore wind power purchase agreements in Germany and Spain.

Specifications of the Platts PPA indices

The following guide contains the specifications for Platts PPA indices. All indices are based on methodology developed by Platts to reflect PPAs based on location, technology and tenor, using Platts' research and primary sub-data.

Each index is calculated daily using in-house Platts pricing models, which are regularly calibrated against market-transacted PPA prices. Platts' pay-as-produced PPA price reference takes into consideration forward power prices, production volumes, price capture rates, risk factors and forward GO price calculations.

The indices are published in euros per megawatt-hour (Eur/ MWh), published for Pay-as-Produced (PaP) contracts, meaning a fixed price for an intermittent quantity of electricity that gets delivered by the renewable project. When the PPA indexes are assessed between January and June, the tenor is assumed to start on Jan. 1 of the front year. When the PPA indexes are assessed between July and December, the tenor is assumed to start on Jan. 1 of the second-year ahead.

Locations: Germany and Spain

Technologies: Solar and onshore wind

Tenors: 10-year tenor

Units: Eur/MWh for Germany and Spain

© 2025 by S&P Global Inc. All rights reserved.

Publication schedule: Platts publishes the PPA indexes on all UK working days.

Timestamp: Each Index reflects a weighted average of price references which is published the following business day.

Indices

Code	Index name
CESJA00	Germany Solar 10-Year Pay-As-Produced PPA Index
CESJB00	Germany Onshore Wind 10-Year Pay-As-Produced PPA Index
CESJC00	Spain Solar 10-Year Pay-As-Produced PPA Index
CESJD00	Spain Onshore Wind 10-Year Pay-As-Produced PPA Index

Solar module assessments

Platts publishes a daily, timestamped spot tradable value for solar modules in China, Europe and the USA. Prices are published as an outright price in US dollar cents per watt. The assessments consider market information reported to Platts and published throughout the day, including firm bids and offers, trades and indicative values, as well as any other data deemed relevant to the assessment process.

Specification: The price assessments reflect modules with 570-720 W of output, TOPCon specification and wafer sizes of 182-210 mm. Other specifications are considered for normalization.

Volume: Platts assesses volumes of 5 MW up to 50 MW, and 50 MW up to 100 MW. Other volumes are considered for normalization.

Publication schedule: The assessments reflect a 4:30 pm London time market close and follow the Platts European publishing schedule. On certain days ahead of some UK Public Holidays, such as Christmas Eve and New Year's Eve, Platts has an earlier assessment timestamp. This is to take account of typically much lower liquidity and the earlier end of trade.

China

The prices reflect FOB loadings 10-30 days forward basis Shanghai. Other locations are considered for normalization.

Europe

The prices reflect modules for delivery on a DDP basis 28-70 days forward with a basis of Rotterdam. Other locations are considered for normalization.

USA

The prices reflect modules for delivery on a DDP basis 28-60 days forward with a basis of the US East Coast. Other locations are considered for normalization.

India

The price assessments reflect modules with 520-680 W output for PERC specification and 570-720 W output for TOPCon specification, with wafer sizes ranging from 182-210 mm, applicable for contract volumes between 5-50 MW.

The assessments are published as outright prices on a FOB India basis and reflect modules scheduled for shipment seven to 30 days forward from the basis location, Mundra. The prices are published in US cents per watt and in Indian rupees per watt.

The assessments reflect an Indian time stamp (1630 IST) and follow the Platts India publishing schedule.

Platts Solar Marker

Platts Global solar marker is a daily arithmetic average of the individual TOPCon 5-50MW solar module assessments.

Revision history

November 2025: Platts completed an annual review of the Specifications Guide European Electricity and made minor edits to the language for greater clarity. Platts discontinued the UK Coal Price Switching Indicator and the UK Generating Fuel Cost Comparison.

August 2025: Platts adds monthly and quarterly volume-weighted capture prices and rates.

July 2025: Platts adds daily India PERC and TOPCon solar module assessments. Platts Global solar maker has been updated to only include TOPCon volumes 5-50MW.

In June 2025, Platts adds daily German and Spanish PPA assessments.

April 2025: Platts adds battery spreads and duration ratios.

October 2024: Platts completed an annual review of the Specifications Guide European Electricity. Platts includes language on contract definitions and flow date pricing.

August 2024: Platts adds solar module assessments.

March 2024: Platts updates the Generating Fuel Cost Comparison table, and includes new locations for Renewable Capture Price Indices.

October 2023: Platts adds Bitcoin Energy Consumption Index. Updates the efficiency rate in the table header to correspond to their description for Dark spreads.

September 20223: Platts completed an annual review of this methodology guide in October and made minor edits to the language for greater clarity.

June 2023: In March 2023, Platts launched Platts-Pexapark Power Purchase Agreement indices (3Pi).

In May 2023, Platts launched UK power day-ahead Block 1+2 assessment.

October 2022: Platts completed an annual review of this methodology guide in October and made minor edits to the language for greater clarity. Platts added the cost of the UK government's Carbon Price Support (CPS) levy for 2022 - 2023, 2023 - 2024 fiscal years. Platts specified which contracts are assessed, contract definitions, assessment ranges, units, publication schedule and time stamps for GOs and REGOs. Platts, part of S&P Global Energy, launched new locations for Bitcoin Quarq Spreads on September 1, 2022.

July 2022: Platts launched peakload spark spreads for the UK, Germany, France and the Netherlands and new baseload spark spreads for France and the Netherlands.

May 2022: Platts launched Bitcoin Quarq spread on May 19, 2022.

December 2021: Platts launched Renewable Capture price indices on December 16, 2021.

October 2021: Platts conducted an annual review of the guide. As part of the review Platts added missing codes for conversions and additional contracts throughout. Platts also clarified calculations and amended the descriptions of symbols to make them more explicit of what they reflect.

June 2021: Platts launched UK Power day-ahead Block 5 in June 30,2021 and started using EUA and UKA Platts assessments for corresponding clean spark and dark from June 18, 2021.

March 2021: Platts added REGO methodology in February 2021 and Netherlands month-ahead assessment in January 2021.

December 2020: Platts to amend UK day-ahead assessments timing to 9:20 am London time, effective January 1, 2021.

October 2020: Platts completed an annual review of the Specifications Guide European Electricity. Platts reviewed all content, corrected typos and made minor edits to language.

October 2019: Platts completed an annual update to the European Electricity methodology and specifications guide. Platts reviewed all content and made minor edits throughout.

September 2019: Platts launched European Guarantee of Origin (EuGO) for current year and year-ahead vintage.

April 2019: Platts completed an annual update to sections 1 to 6 of Platts Methodology and Specifications Guides in April 2019, and moved these sections into a standalone Methodology Guide.

April 2019: Platts clarified the emissions intensity factor used in its German clean dark spreads with 45% efficiency.

October 2018: Platts has replaced the use of EEX German/Austrian (DE/AT) power price component in with Germany-only (DE-only Phelix) settlement prices. Platts also launched Spanish day-ahead spark spread and clean spark spreads with both 45% and 50% efficiency.

July 2018: Platts launched Spanish spark and clean spark spreads for the Month-ahead, +1, Year-Ahead +1 and Italian Year-ahead, with both 45% and 50% efficiency.

May 2018: Platts removed references to German, French, Italian and Spanish prompt and forward price assessments following the discontinuation of these markets on May 29, 2018. Platts also updated the fuel spread sections of this methodology guide to change the source of European power prices from Platts assessments to third-party exchanges.

May 2018: Platts completed an annual update to the European Electricity methodology and specifications guide. In this update, Platts revamped the guide to introduce greater consistency of layout and structure across Platts' published methodology guides. Platts also reviewed all content during this update.

© 2025 by S&P Global Inc. All rights reserved.

March 2018: Platts removed references to Belgian and Dutch weekly power assessments and spark spreads following the discontinuation of these markets on March 5, 2018.

October 2017: Platts launched Spanish spark and clean spark spreads for the Quarter-ahead, Quarter-Ahead +1 and Year-ahead, with both 45% and 50% efficiency.

October 2017: Platts discontinued French Month-ahead+1, Month ahead+2, Year ahead+1, and Year ahead+2 base and peak power assessments. Platts also replaced French Saturday and Sunday power prices with the Weekend assessment for the flow date price data set. In addition, Spanish Day-ahead, Weekend, Month-ahead+1 and Quarter-ahead +2 baseload assessments were also discontinued. From October 2, French and Spanish Week-ahead contracts are only assessed on the last working day of the week.

May 2017: Platts updated the clean fuel spread sections of this methodology guide to change the source of European emissions prices from Platts assessments to third-party exchange.

February 2017: Platts removed references to duplicate UK index symbols which were discontinued on February 3, 2017.

January 2017: Platts completed an annual update to the European Electricity methodology and specifications guide. In this update, Platts revamped the guide to introduce greater consistency of layout and structure across Platts' published methodology guides. Platts also reviewed all content during this update and introduced code lists. Methodologies for market coverage were not changed.

January 2017: Platts discontinued prompt power assessments for Switzerland, the Netherlands and Belgium. Platts also discontinued forward assessments of Dutch peakload contracts and Dutch quarter-ahead + 1 baseload and moved to weekly reporting for remaining Dutch and Belgian power assessments and associated spark and clean spark spreads. Platts discontinued the following calculated indices: Platts Power Index (German PPI); Continental European Forward Power Price indices; PEP and CONTI indices.

November 2016: Platts clarified the day-ahead definition for European spark spreads.

October 2016: Platts discontinued UK week-ahead and week-ahead+1 base and peak power assessments.

October 2016: Platts updated the Spark Spreads section of this guide to reflect the renaming of its Spanish gas assessments to PVB (formerly AOC).

September 2016: Platts updated the Currency conversions section of this guide. The source and timestamp for the foreign exchange data used to convert Platts European electricity assessments to foreign currency equivalents was revised from Tullett Prebon at 16:00 London time to Platts 16:30 London time assessment. Platts also removed references to the previous calculations for exchange rates. Prior to June 2014, exchange rates were published with a working-day time lag, with the previous day's exchange rate close used in calculations.

August 2016: Platts updated this guide to remove references to CEE and Turkish power assessments and to Turkish dark and spark spreads. Platts discontinued assessments of the Czech, Hungarian, Polish and Turkish power markets. Turkish dark and spark spreads were also discontinued. Price history remains available in Market Data categories EE, PE and EM.

November 2015: Platts introduced additional German dark spread indicators, with a fuel efficiency factor of 45%.

September 2015: Platts discontinued its assessments of German month-ahead+4 and month-ahead+5 baseload and peakload electricity contracts.

March 2015: Platts discontinued publishing cross-fuel comparisons containing Gasoil 0.1% sulfur content and Fuel Oil 3.5% sulfur content.

December 2014: Platts updated the plant efficiencies and rates in its cross-fuel comparisons on December 16, 2014. Previous plant efficiencies were: Gas 49% (UK) and 54% (western Europe), Fuel Oil: 32%, Gasoil: 32%, Coal: 34%. Previous kg CO2/MMBtu rates were 101.5 for coal, 55 for natural gas and 72.5 for oil.

April 2014: Platts revised the emissions intensity factor used in its spark spreads to 0.053942 tCO2e/MMBtu HHV from 0.055 with effect from April 1, 2014. The energy conversion factor (coal) used in dark spreads was revised to 6.978 from 7.1 and the emissions intensity factor used in clean dark spreads was revised to 0.973 mtCO2/MWh from 0.96.

March 2014: Platts discontinued its assessment of the UK April Annual contract.

January 2014: Platts moved its day-ahead timestamp to 11:00 am from midday as of January 2, 2014.

November 2013 – September 2014: Platts transitioned its UK forward power assessments to the Gregorian calendar from the EFA calendar. The last EFA roll date was September 29, 2014, and the first Gregorian roll date was November 3, 2014.

November 2013: Platts launched assessments of EFA-Gregorian "gap" products covering the following dates: September 29-30, 2014 and March 30/31, 2015. Assessments were only published in the event of trade or firm and verifiable indications of market value.

November 2009: Forward time stamp alignment to 16:30 London time as of November 1.
